

## ABSTRACT OF THE DISCLOSURE

An insertion structure of partitioning slat of a receptacle, including: a pair of first assembling bodies oppositely disposed in the receptacle at intervals, a middle section of each first assembling body being formed with at least one first insertion slit; a pair of second assembling bodies disposed in the receptacle and positioned between two ends of the first assembling bodies; and a first partitioning slat two ends of which are respectively formed with two first insertion bodies for inserting in the first insertion slits. Each first insertion body includes a first fitting section and a first projection. The first fitting section is fitted through a corresponding first insertion slit. The first projection upward extends by a certain height from one end of the first fitting section in a direction of the short side of the first partitioning slat. The first projection is engaged with a corresponding first assembling body to form a firm and easily detachable structure for varying the interior space of the receptacle for accommodating different sorts of articles.
